Mobile session screens: SOTI ideas for Simpnify

2 October 2026 · Design review · A our design, then B–E the SOTI flow

Read part 1 in order. **A** is our design: the browser page Active session detected. **B, C, and E** are the SOTI Lockdown story. B is the screen already on the shared phone before anyone signs in. C is the badge, with password as a button. E confirms this phone is signed in. D is removed.

WORTH TAKING FROM SOTI

- Lockdown with SSO, so the phone opens without a typed password
- NFC badge login for a shared device
- Logout that clears the handphone before the next officer
- Admin help when the device itself is stuck

LEFT WITH SOTI

- Fleet enrollment, OS updates, and printer management
- Remote viewing of the officer's screen
- Snap form builder (guidance and reports already cover that)
- Geofences that install or remove apps

PART 1 · SESSION SCREENS

- **A** · Our design
- **B** · Step 1. Sign in, with a badge
- **C** · Step 2. Tap the badge

PART 2 · PROFILE, SETTINGS, AND LOCK

The native drawer, settings toggles, language, and logout (variant B in the settings review) stay as drawn. Variants C, D, and E add auto-lock, device health, and console lock from SOTI.

- **C** · Auto-lock for shared handphones
- **D** · Device status in Profile
- **E** · Locked from the console

LEFT WITH SOTI (SETTINGS)

- Remote wipe and remote screen viewing
- App install and OS update controls

PART 3 · ONE SHIFT: BRIEFINGS, TODAY, LOCATION, GUIDANCE

Officer Tan works the Gate 2 post phone. Each chapter combines the two SOTI ideas for that module into the screens she sees, built on the native layouts (purple header, teal card, status tags, mint location card, SOS). A panel shows what the admin sees at the same moment: the handphone and the step, never the officer's screen.

- **1** · Briefings: read before shift
- **2** · Today: handphone health and offline
- **3** · Location: zone, battery policy, update now

- **4** · Guidance: tag scan and ask for help

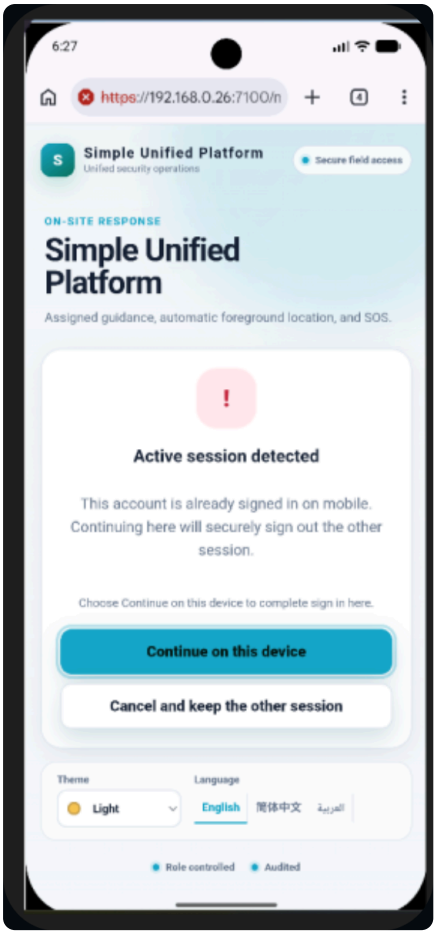

PART 4 · WORK MODULE: REPORTS, EVIDENCE, PATROLS

The native Work hub, Reports form, and picker sheet (variant B in the Work review) stay as drawn. Variants C, D, and E add asset scanning, an offline queue with sync status, and a live patrol route from SOTI.

- **C** · Scan the asset
- **D** · Saved on this phone
- **E** · Patrol with checkpoints

LEFT WITH SOTI (WORK)

- Snap form builder, since guidance and reports already cover forms
- Geofences that install or remove apps

A Our design

> **Our design.** The active-session browser screen from the screenshot. Kept as the reference beside the SOTI flow.

DESCRIPTION

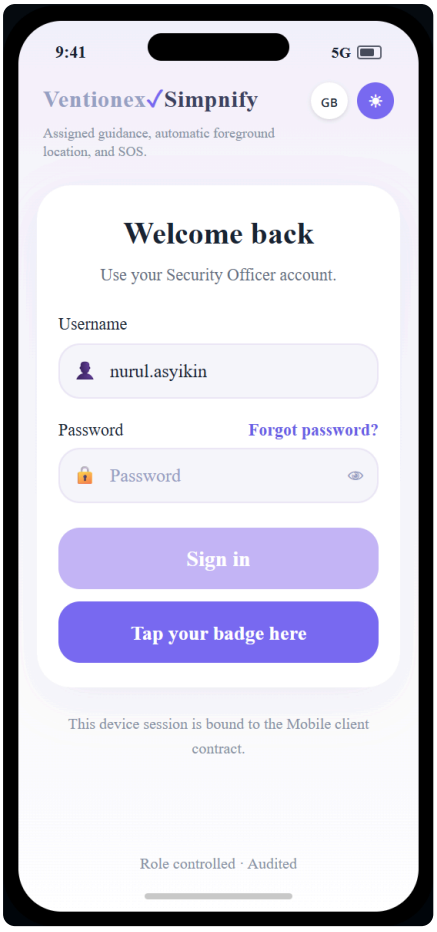

The officer opens the field app in the phone browser. The page is Simple Unified Platform, then Active session detected. Continuing here signs out the other session. The two actions are Continue on this device, and Cancel and keep the other session. Theme, language, Role controlled, and Audited stay on this screen.

PROS

+ The choice is already named: this device, or keep the other session
+ Says the other session will be signed out
+ Same words as the live page

CONS

– The product title sits above the decision
– Does not say which phone, or that location and SOS stop there
– Theme and language sit on the same screen

B Step 1. Sign in, with a badge

> **From SOTI.** SOTI Lockdown login profile. A shared phone keeps a sign-in screen up until someone logs in, and users can log in with an NFC tag. See soti.net/solutions/lockdown.

DESCRIPTION

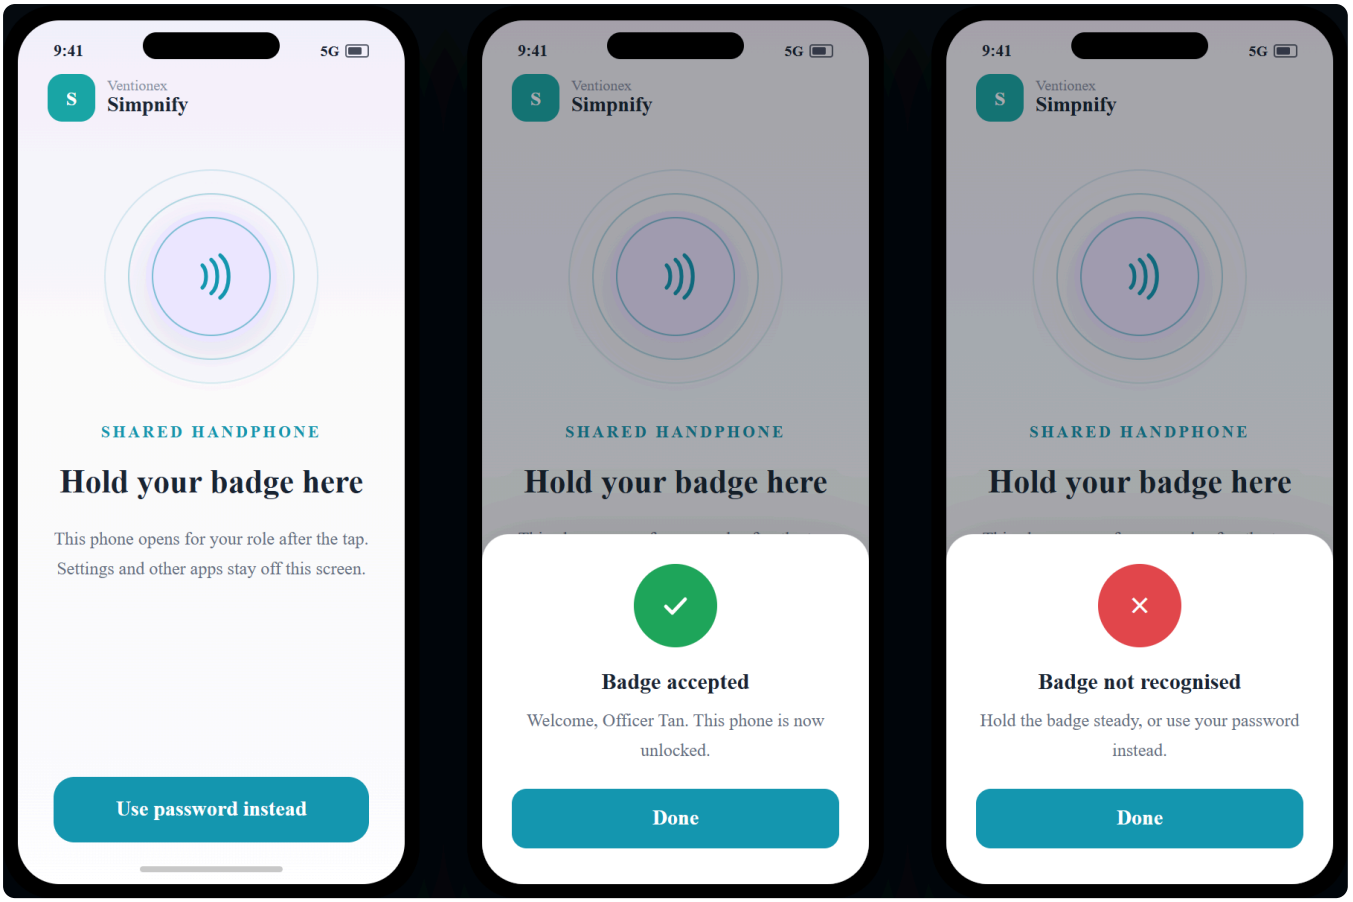

Your Welcome back page, used as B. Tap your badge here is the NFC button. Username, password, and Sign in stay underneath for when the badge misses.

PROS

+ This is already the sign-in door, which is the job of SOTI's login profile
+ The badge is a button on the page the officer already uses
+ Username and password stay underneath

CONS

– It is still the browser page, so hiding the phone home screen stays with device management
– Theme and language stay on the sign-in screen

C Step 2. Tap the badge

> **From SOTI.** SOTI Identity NFC sign-in, with SSO. The tap is the sign-in.

DESCRIPTION

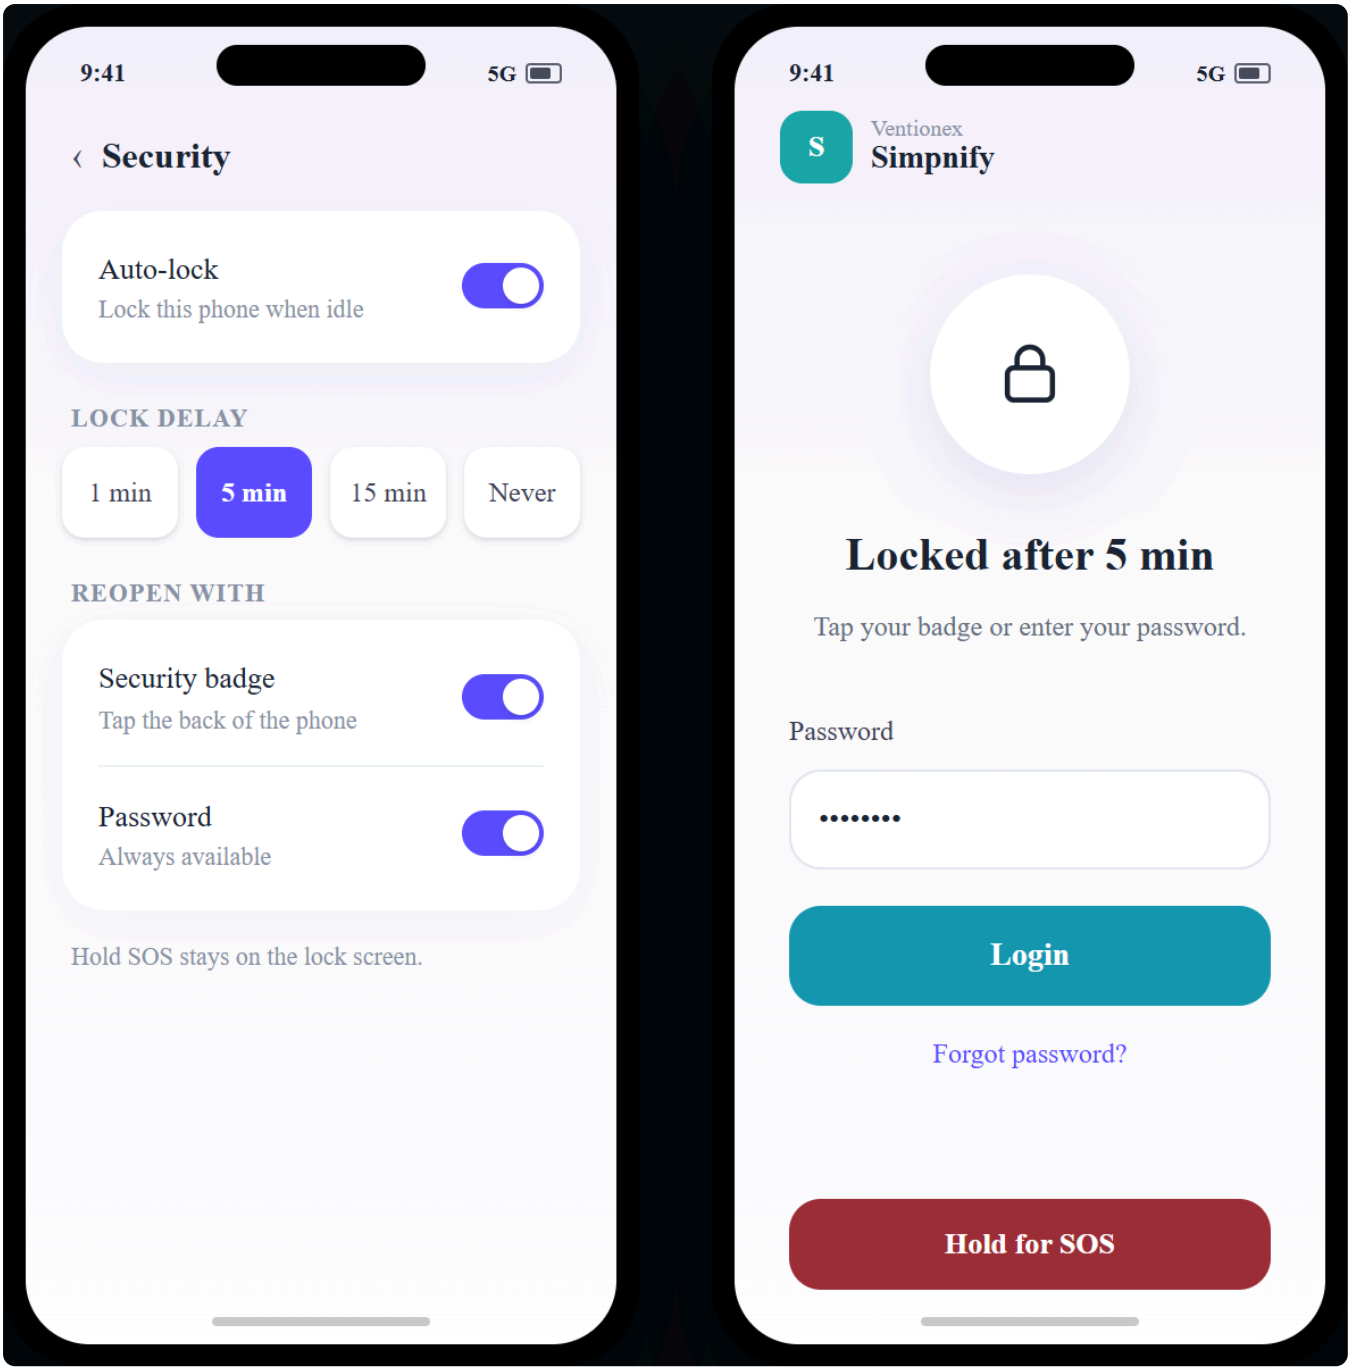

Same phone as B. The officer holds their badge to the phone. The tap says who is holding it. Use password instead is a button under the badge.

PROS

+ The phone knows the officer without a password
+ Password stays as a button when the badge misses

CONS

– Needs a badge and NFC on the phone
– Password is the fallback when the badge misses

C Auto-lock for shared handphones

> **From SOTI.** SOTI Lockdown timeouts and shared-device sign-in. The phone re-locks, and a badge tap or password reopens it.

DESCRIPTION

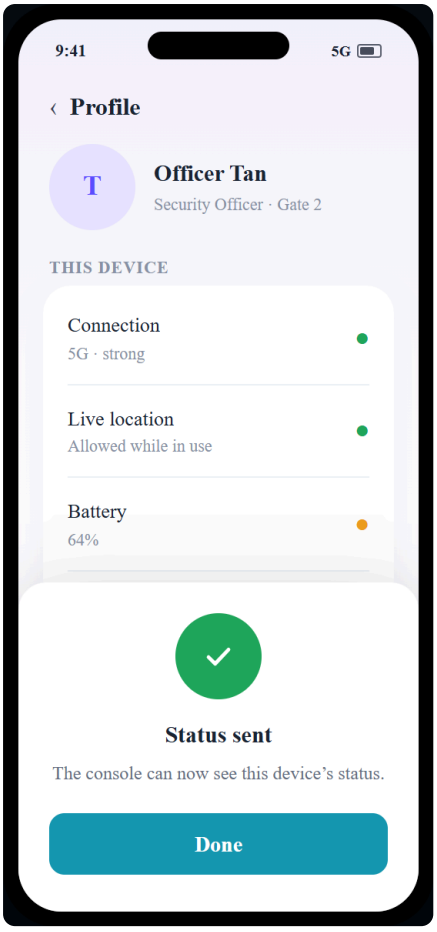

The Security Settings screen gets a lock delay (1, 5, 15 minutes or never) and a choice of how the officer comes back: security badge, password, or both. When the timer runs out, the phone shows a locked screen that says how long it was idle and accepts the badge or password. Hold for SOS stays on the lock screen so safety is never behind the lock.

PROS

+ Turns the Lock delay setting into a clear rule officers can read
+ Badge resume means no password typed on a pool phone
+ SOS stays reachable while the screen is locked

CONS

– Badge resume needs NFC on the handphone
– A short delay can lock an officer out mid-incident, so the minimum needs care

D Device status in Profile

> **From SOTI.** The officer-facing slice of SOTI MobiControl and XSight device health, shown to the person holding the phone.

DESCRIPTION

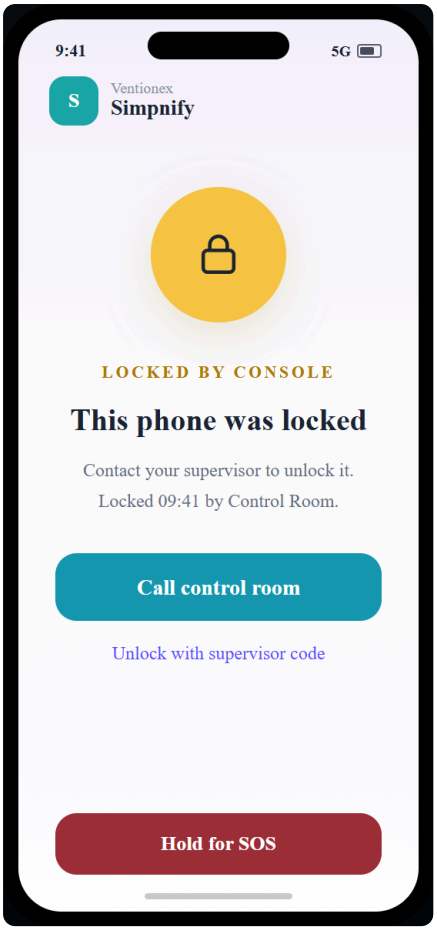

The Profile screen gets a "This device" card: connection, live location permission, battery, last sync, and app version, each with a status dot. A "Send status to console" button shares the same facts the console sees, and a green popup confirms it was sent. The officer can answer "is my location live?" without calling anyone.

PROS

+ Answers "is my location live?" without calling the console
+ Same facts the console sees, so a support call starts from them
+ Fits under the profile screen already designed

CONS

− One more card on a screen that is currently clean
− Needs real permission checks, not a static label

E Locked from the console

> **From SOTI.** SOTI remote lock. The console locks the handphone. Remote wipe and screen viewing are left out.

DESCRIPTION

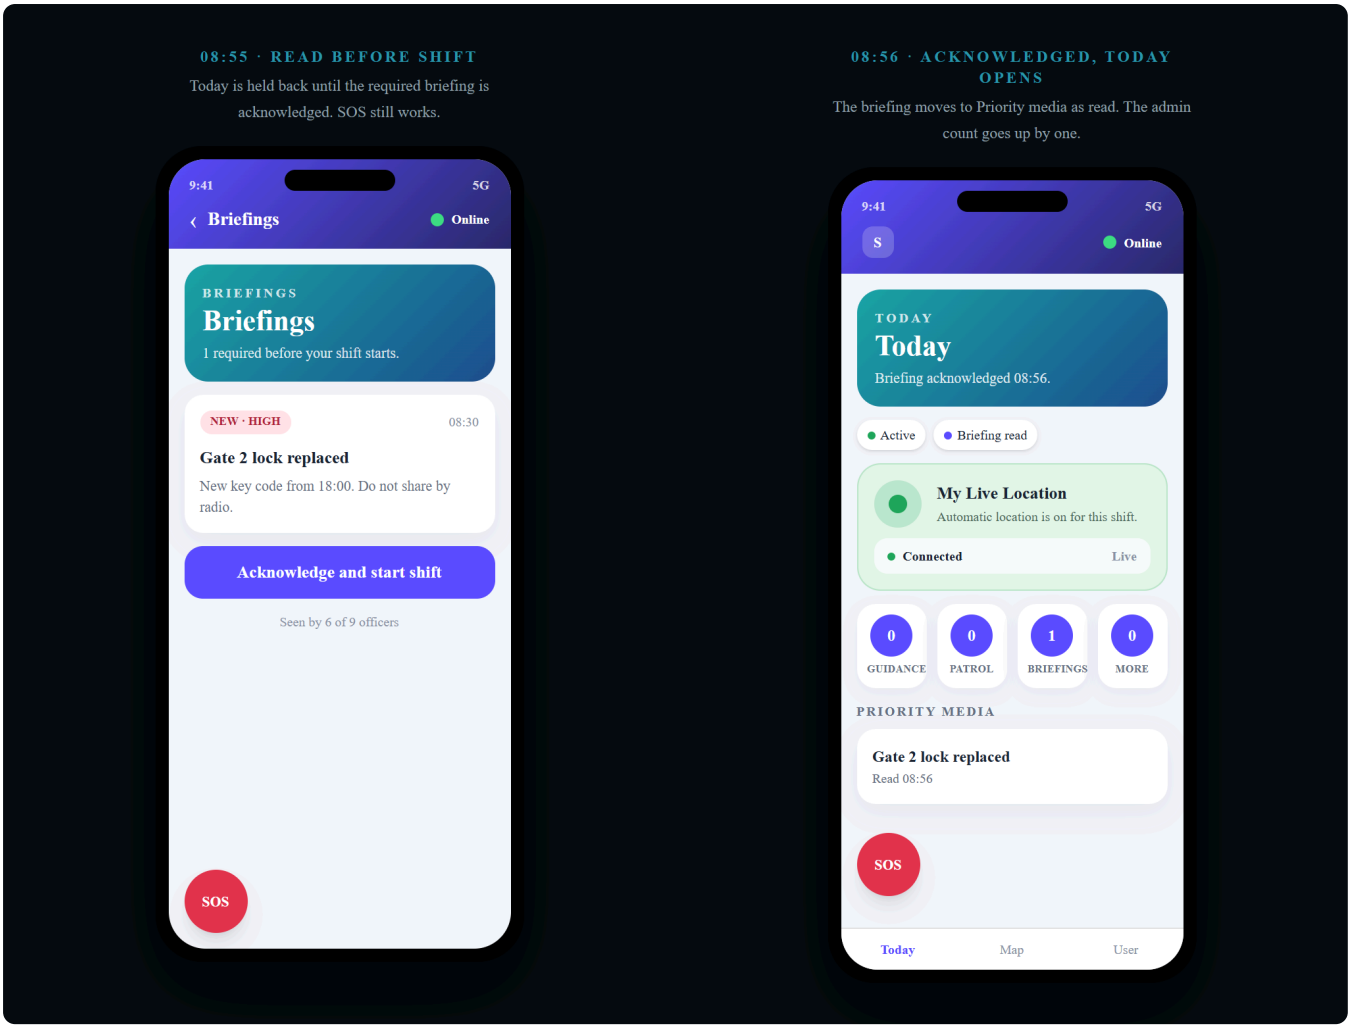

When the console locks a lost or reassigned phone, the officer sees a yellow “Locked by console” screen that says who locked it and when, with a Call control room button and a supervisor-code unlock. Hold for SOS still works from this screen. It covers the lost-phone case without remote screen viewing.

PROS

+ Says why it is locked, instead of asking for a password
+ Lost-phone case is covered without remote screen viewing
+ SOS still works from this screen

CONS

– Needs a console control and a rule for who may lock a phone
– A false lock during an incident is costly, so unlock must be quick

1 Briefings: read before shift

> **From SOTI.** SOTI content push with read confirmation, and the Lockdown idea that a handphone shows only what policy allows until a condition is met.

Combines: Pushed briefing with acknowledge, plus read-before-shift gate

DESCRIPTION

Officer Tan picks up the Gate 2 post phone at 08:55. Today stays closed until she acknowledges the one required briefing. One tap tells the admin she has read it, and Today opens with the briefing marked as read. SOS still works throughout.

WHAT THE ADMIN SEES

- Briefing: Gate 2 lock replaced
- Acknowledged: 7 of 9
- Still unread: Lim, Rao

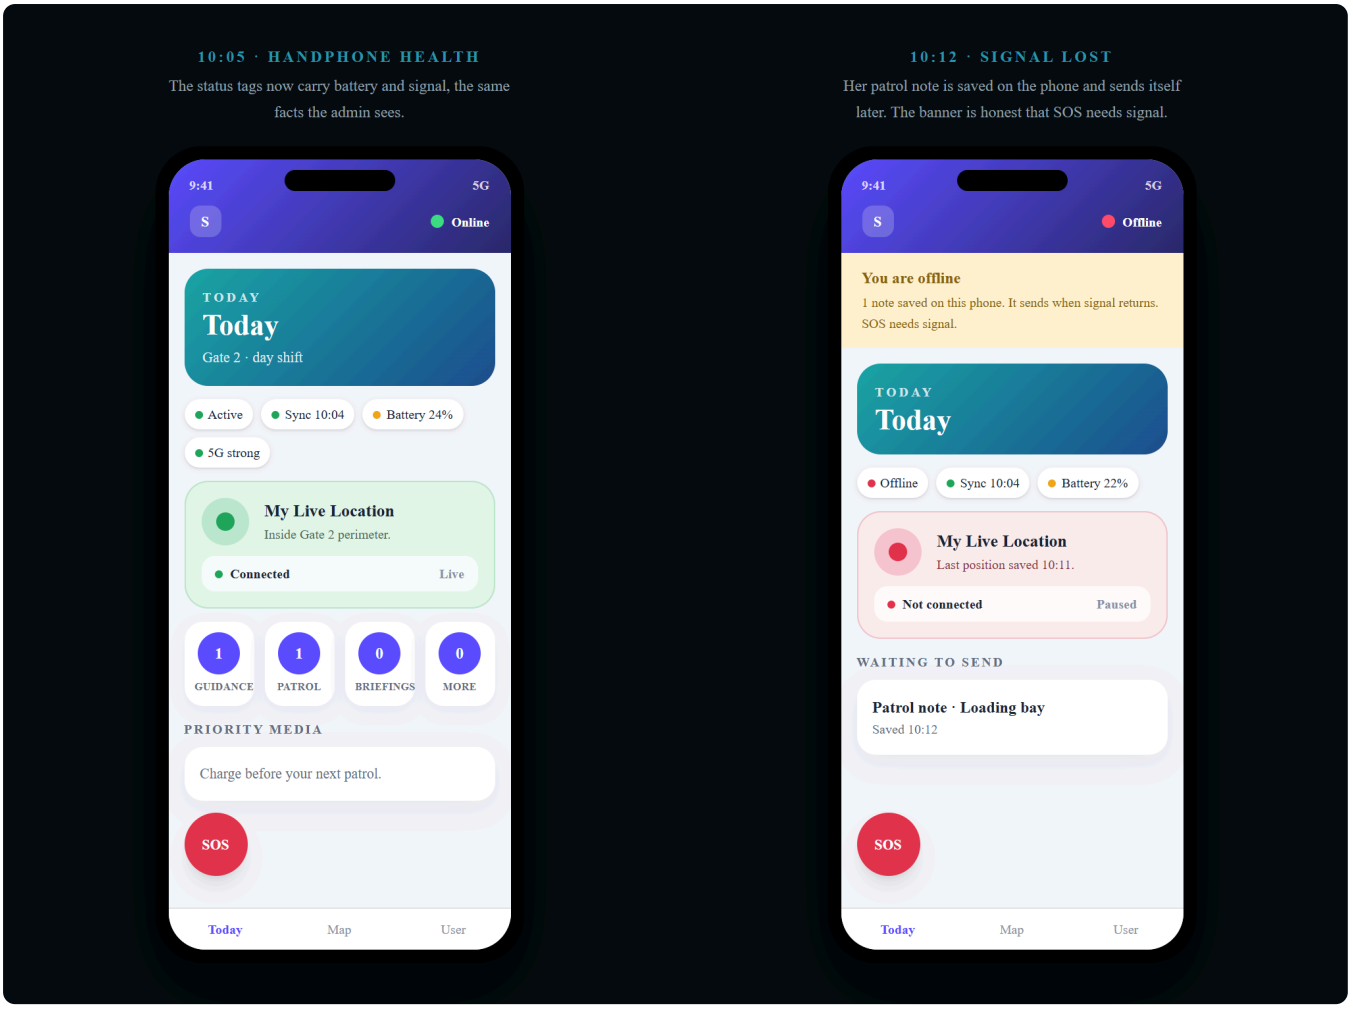

PROS

+ Nobody starts patrol unbriefed
+ The admin can see who has read it and chase the rest

+ One action, no typing

CONS

- Officers may tap without reading
- Needs an override for a supervisor if a briefing is wrong or long

2 Today: handphone health and offline

> **From SOTI.** SOTI XSight device health (battery, connectivity, last check-in), and field work that keeps running offline and syncs on reconnect.

Combines: Handphone health strip, plus offline banner and waiting-to-send

DESCRIPTION

At 10:05 the status tags show battery, signal, and last sync, the same facts the admin sees. At 10:12 signal drops: a banner sits flush under the header, the header shows a red Offline dot, the Live Location card turns red, and the patrol note is saved on the phone to send later. SOS is stated plainly as needing signal.

WHAT THE ADMIN SEES

- Handphone: Gate-2-PH
- Battery: 22%
- Connectivity: offline since 10:12

PROS

+ Officer knows the phone is fit before a patrol
+ Nothing is retyped because a note looked lost

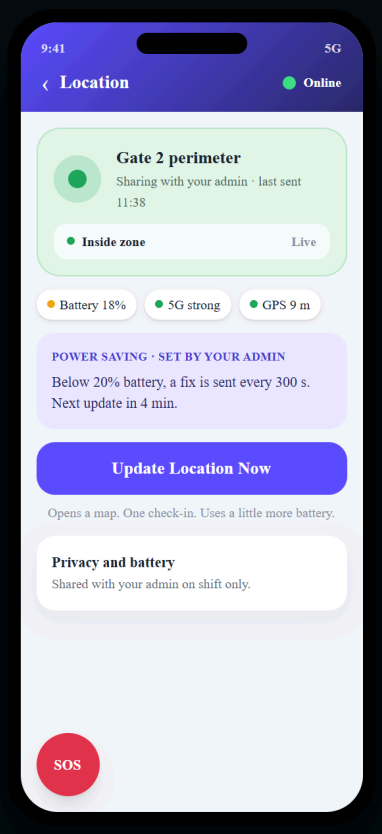

+ Online and Offline are visible in the header on every screen

CONS

- Needs a local queue in the native app
- Needs real battery and signal reads, not static labels

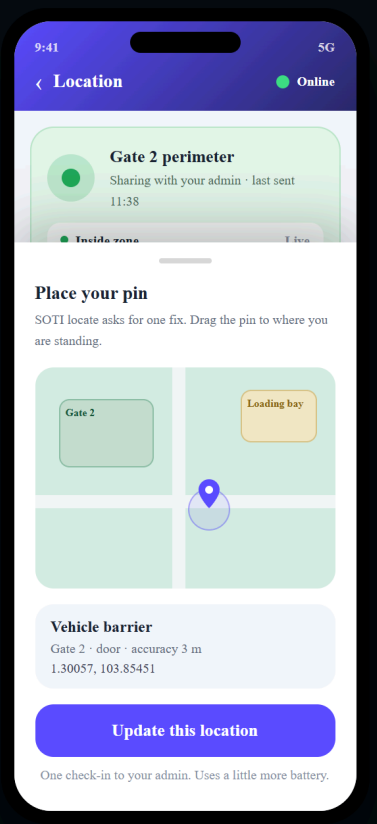

11:40 · POWER SAVING, STILL IN ZONE

The update rate is stated on the card. Update Location Now opens a map for one precise check-in.

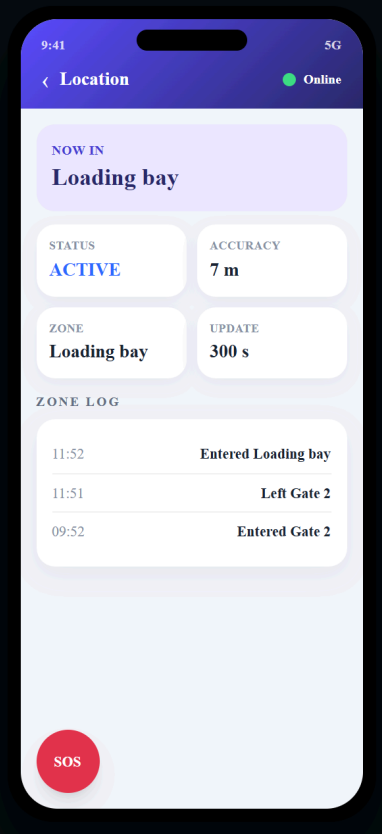

11:41 · DRAG THE PIN

The GPS fix is 9 m off. She drags the pin to the vehicle barrier, then sends that point.

11:52 · LEAVES THE ZONE

Entry and exit are a plain log, not a movement trail.

3 Location: zone, battery policy, update now

> **From SOTI.** SOTI locate sends one device check-in. When that GPS fix is coarse, the officer drags the pin to the exact spot before it is sent. Geofencing stays a status and a log, and the admin battery policy is unchanged.

Combines: Zone status and exit log, plus battery-aware tracking

DESCRIPTION

At 11:40 the battery reaches 18%. The Location screen names the zone (Gate 2 perimeter), shows battery, signal and GPS accuracy, and states the admin-set power saving policy with the time of the next update. Update Location Now opens a map. The officer drags the pin to the precise spot (the vehicle barrier), sees the place name, accuracy and coordinates update, then sends that one check-in. It uses a little more battery. At 11:52 the exit from Gate 2 and entry to the loading bay appear as a plain log.

WHAT THE ADMIN SEES

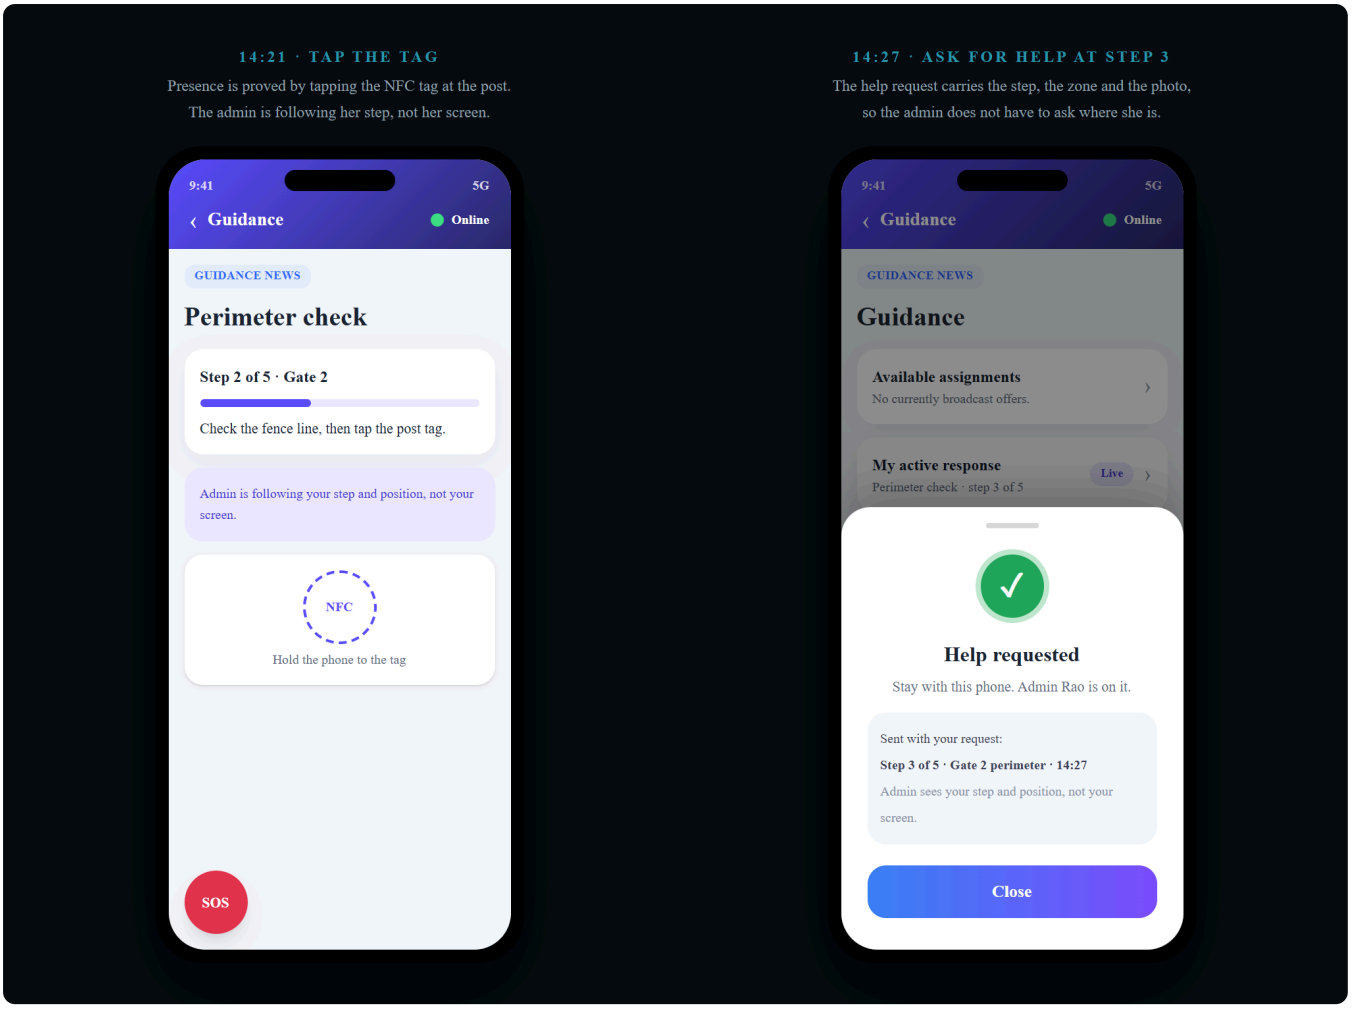

- Officer: Tan, Gate-2-PH
- Check-in: Vehicle barrier, pin dragged
- Update rate: 300 s (power saving)

PROS

+ A coarse GPS fix can be corrected before it is sent
+ The admin sees the point and the zone, never the screen
+ Policy is shown, not hidden

CONS

– Needs zones drawn per site
– Poor accuracy indoors can flip the zone status

4 Guidance: tag scan and ask for help

> **From SOTI.** SOTI rugged-handphone scanning (NFC and barcode) to prove presence, and XSight-style live visibility limited to the step and not the screen.

Combines: Scan to confirm a step, plus admin follows my step

DESCRIPTION

At 14:20 the admin assigns a perimeter check. Tan proves each checkpoint by tapping the NFC tag at the post, and the screen says the admin is following her step and position, not her screen. At step 3 she asks for help from inside the step. A bottom sheet confirms the request and shows exactly what was sent: step 3 of 5, Gate 2 perimeter, 14:27.

WHAT THE ADMIN SEES

- Check: Perimeter check, Tan
- Step: 3 of 5, Gate 2 perimeter
- Help requested: 14:27

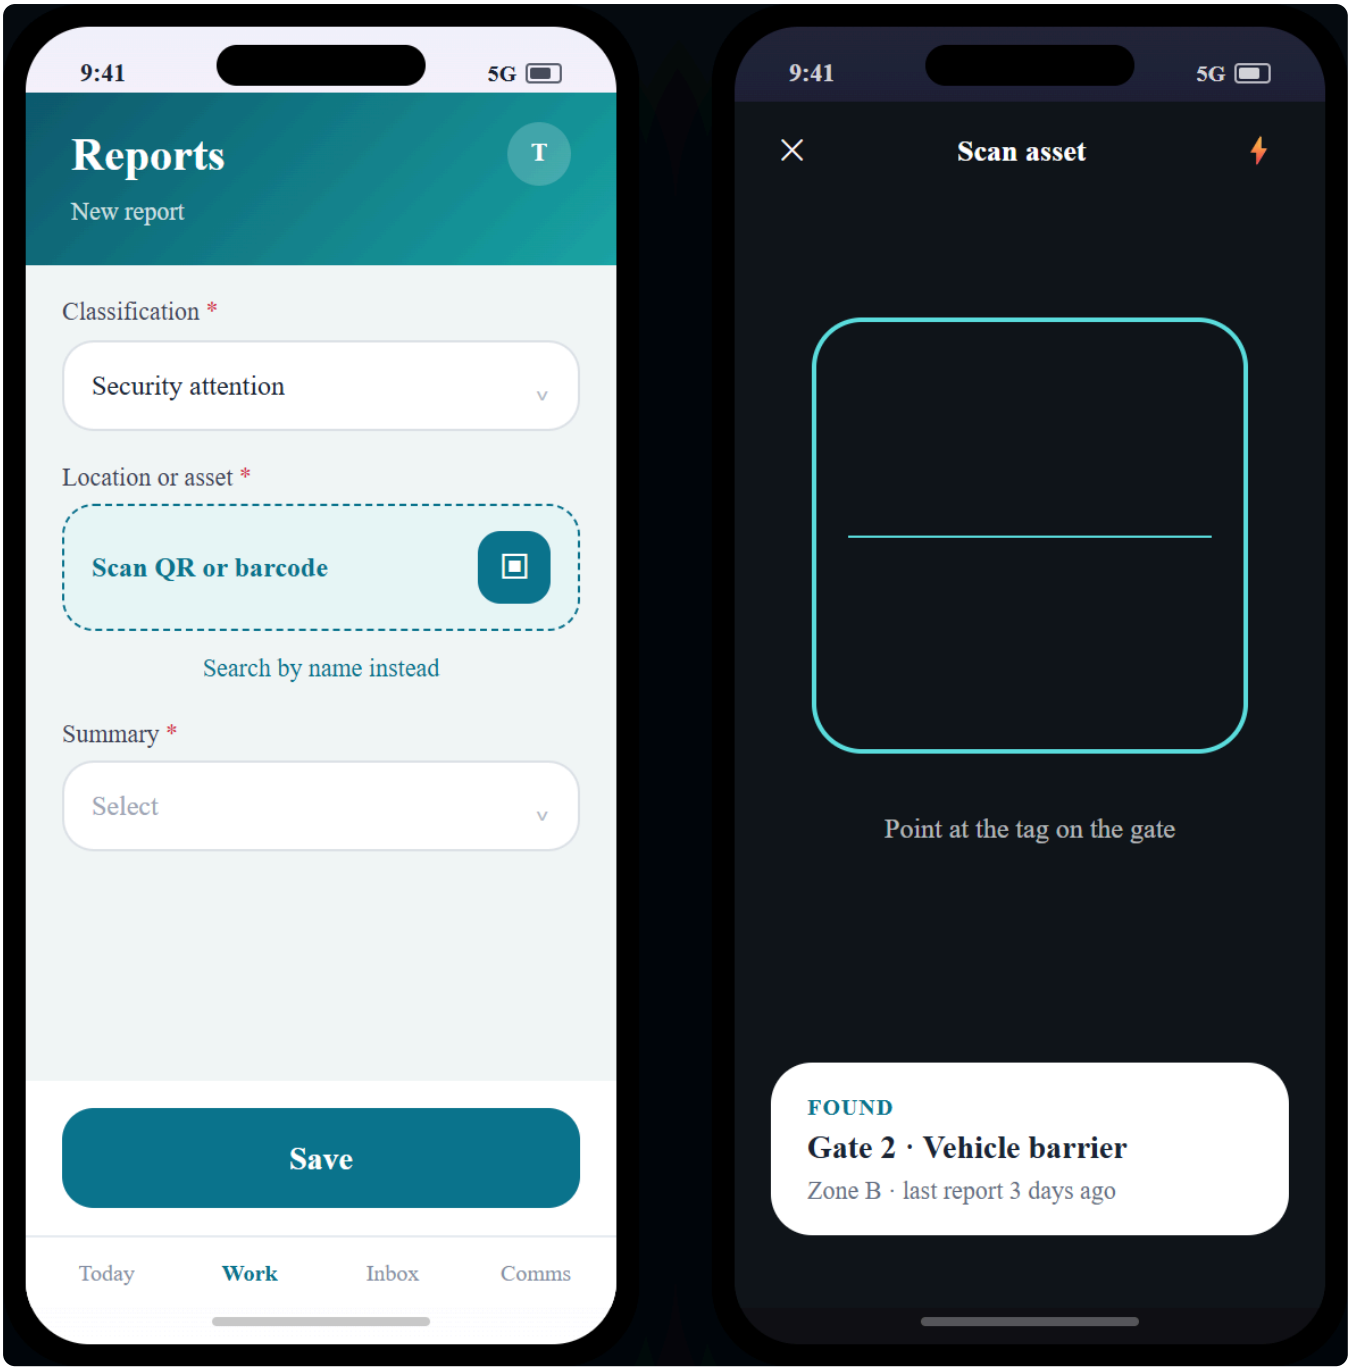

PROS

+ Proof of presence without typing
+ The help request carries step and place, so nobody has to ask where she is

+ No remote view of the phone

CONS

- Tags must be fitted at each point
- Officers may feel watched, so the wording matters

C Scan the asset

> **From SOTI.** SOTI Snap forms capture barcodes and QR codes from the camera. Only the scan field is taken, not the form builder.

DESCRIPTION

On the Reports form, Location or asset becomes a Scan QR or barcode button first and a search second. The camera opens, finds the tag on the gate, and fills in Gate 2, Vehicle barrier, Zone B, so the report points at a real asset record. Search by name stays as the fallback.

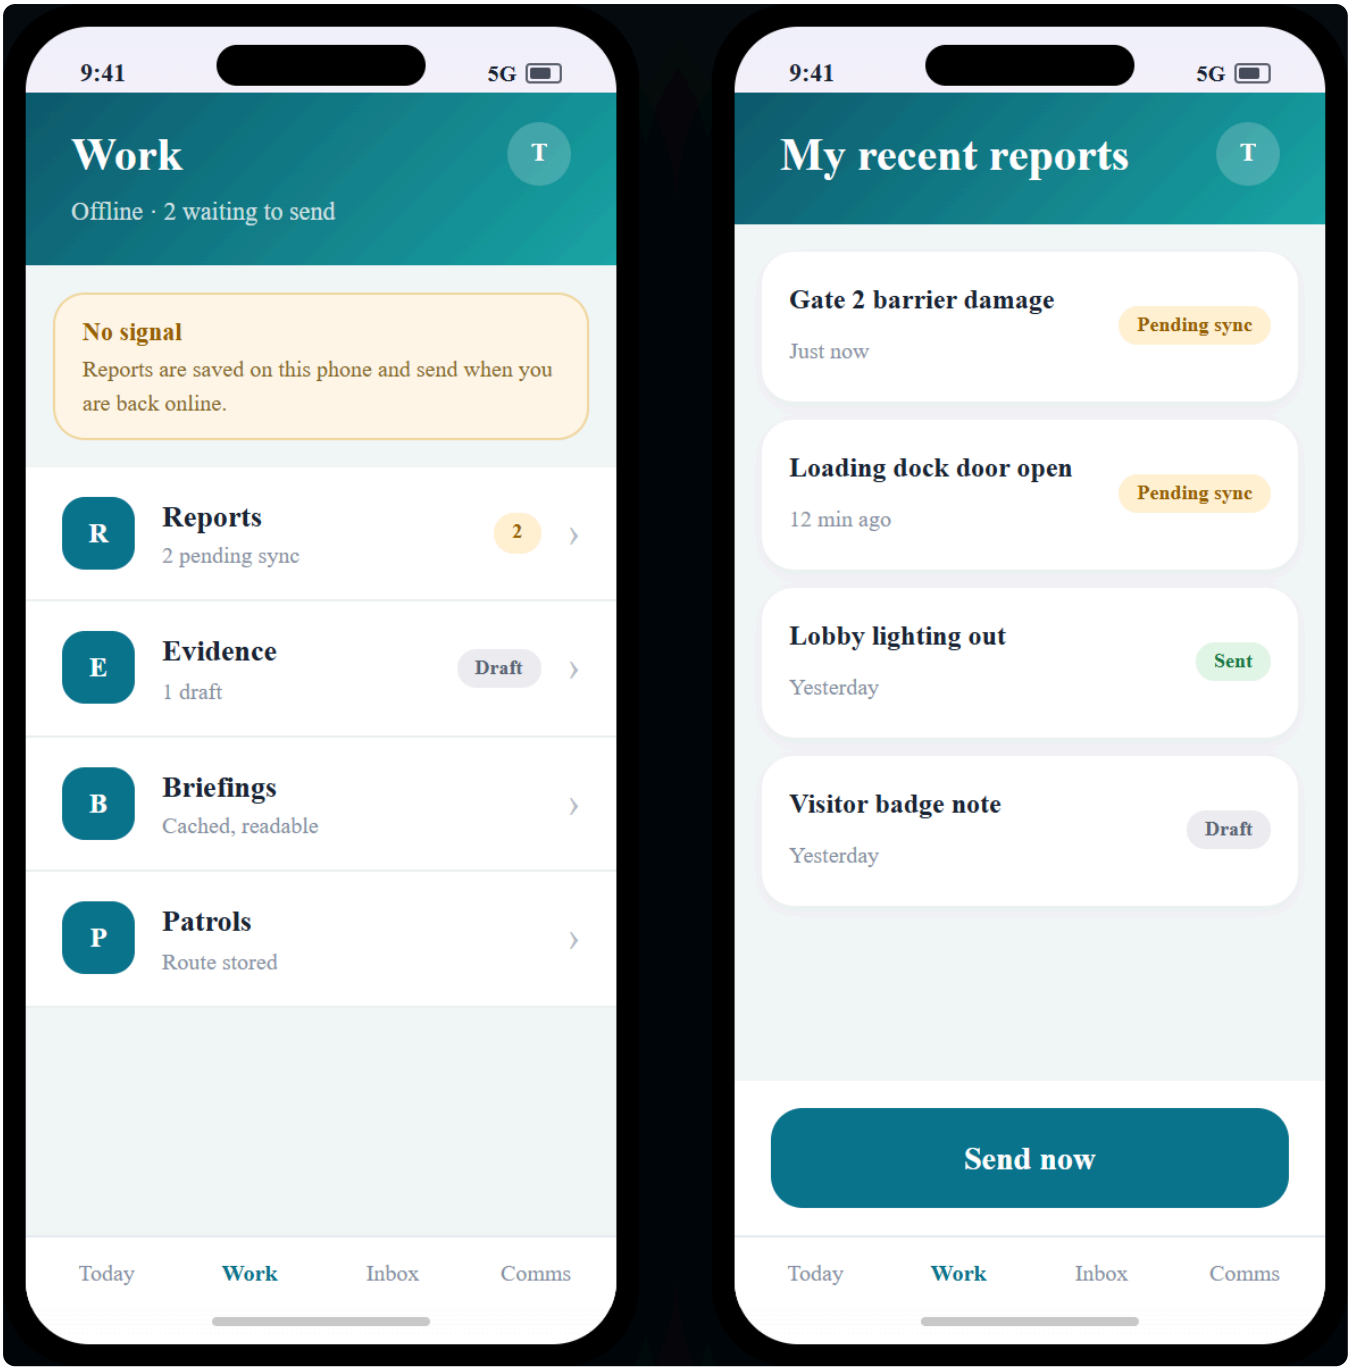

PROS

+ No typing a location with gloves on

+ The report always points at a real asset record
+ Search stays as the fallback

CONS

– Needs asset labels or QR tags at the site
– Camera permission has to be asked once

D Saved on this phone

> **From SOTI.** SOTI mobile apps keep working offline and sync later. Only the sync status is taken, not device management.

DESCRIPTION

With no signal, Work shows a banner saying reports are saved on this phone and will send when back online. Each report in My recent reports carries a Draft, Pending sync, or Sent chip, and a Send now button is available. The same chips work for Evidence, Briefings, and Patrols.

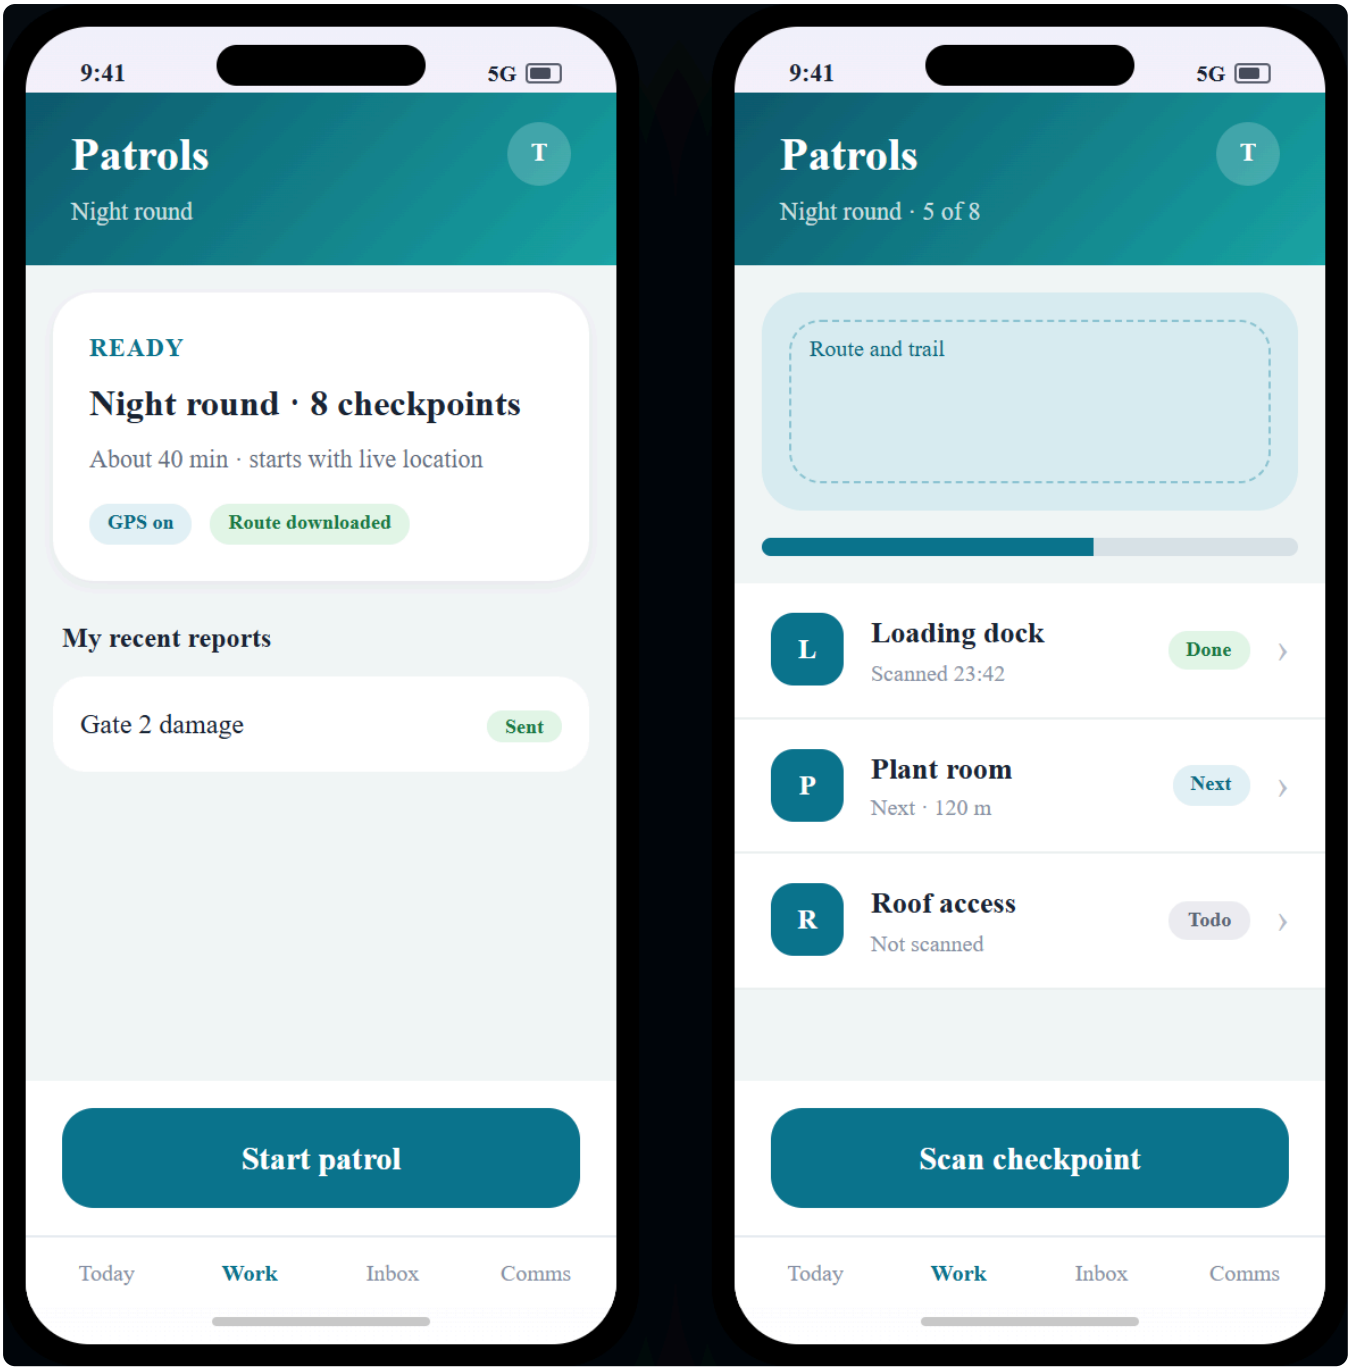

PROS

+ The officer knows nothing was lost

+ Same status chips work for Evidence, Briefings, and Patrols
+ Matches the Offline field solution page

CONS

– Needs a rule for large attachments
– Two officers editing one report offline needs a conflict rule

E Patrol with checkpoints

> **From SOTI.** SOTI location tracking and geofencing show where a device is. Only the trail and checkpoint check-in are taken, not app push.

DESCRIPTION

Start Patrol shows the route (8 checkpoints, about 40 minutes, GPS on, route downloaded). Once started, the screen shows the route and trail, a progress bar (5 of 8), the checkpoints done, next, and to do, and a Scan checkpoint button. A report from a checkpoint is already tagged with place and time.

PROS

+ Progress and next stop are visible at a glance
+ A report from a checkpoint is already tagged with place and time
+ Reuses the live location the Today screen already shows

CONS

– Needs checkpoints defined in the console
– A missed scan needs a clear manual override
